

Testal

DIAGNOSTIC TESTING

Testal undertake structural, diagnostic and geotechnical monitoring on buildings, bridges, car parks and industrial premises.

We have a specialist facility for monitoring noise, vibration and environmental dust and gases. Surveys of structures are undertaken to assess the nature and extent of any defects, their probable cause and to allow development of repair strategies.

Testal consists of a team of specialist engineers who oversee contracts from start to finish ensuring a consistency of

service and attention for our Clients. Our resources are deployed throughout the UK with personnel located in the South East, South West, Midlands, North West, North East and Scotland. This decentralisation improves our service to the Client through quick response times and local knowledge.

Testal has worked with a wide variety of clients, including local governments, utility companies

Testal has continually improved the service offered through continued investment in state of the art equipment.

and consulting engineers and has received repeat business from clients who appreciate the performance, expertise, quality and professionalism that Testal's focussed, customer driven approach is consistently able to deliver.

As well as providing the conventional diagnostic and structural investigation services, Testal can offer highly specialised tests, such as dynamic resonant frequency testing of floors, sound insulation testing and, where appropriate, have the expertise to create bespoke systems to meet specific client requirements.

Having been pile testing since 1979, Testal are also established as worldwide experts for dynamic pile testing, sonic logging and integrity testing of piles (all of which are UKAS accredited).
